Website Performance & Health Audit

Fort Knox Mailbox · Homepage, Collection & Product pages

Tested on
Desktop & Mobile

Overview — All Three Pages

> **The big picture.** Across the homepage, the collection page and a product page, the site has **strong foundations**: it's secure, it's set up well for Google search, and most pages are steady on screen. The shared weakness is a **heavy load of marketing and tracking code** that runs on every page and makes them slow to respond while loading. The **product page** has one extra issue the others don't — its content **shifts as it loads**.

Scores out of 100. Performance is shown as **desktop / mobile**; the other three don't depend on the device.

90–100 Good · 50–89 Needs work · 0–49 Poor

PAGE	PERFORMANCE (D / M)	ACCESSIBILITY	BEST PRACTICES	SEO
Homepage	56 / 48	76	77	92
Collection page	71 / 74	87	73	100
Product page	55 / 52	86	73	92

Speed scores move a few points each time a page is tested — normal for pages carrying this much advertising/tracking code.

Issues shared across the whole site

- **Heavy marketing/tracking code** on every page (hundreds of KB unused) — the main speed drag. Fixing it once benefits the whole site.
- **No "main content" marker** (`<main>`) on any page — an accessibility gap for screen-reader users.
- **Third-party cookies** (10–12 per page) — increasingly blocked by browsers.
- **Two security protections missing** — anti-framing ("clickjacking") and a confirmed secure-address redirect.
- An automated check **falsely flags the title/description as missing** on every page — they are present and correct (verified by hand).

Page 1 — Homepage

www.fortknoxmailbox.com

In plain terms. Strong foundations — secure, strong search visibility, steady layout — but the page is **slow to become usable** (speed score in the high-40s on mobile). The heavy load of marketing/tracking code makes it **slow to respond to taps and clicks** while loading. That is the top thing to improve.

🖥️ Desktop visitor

56	76	77	92
Performance (speed)	Accessibility (ease of use)	Best Practices (security)	Search (SEO)

📱 Mobile visitor

48	76	77	92
Performance (speed)	Accessibility (ease of use)	Best Practices (security)	Search (SEO)

Only the Performance (speed) score differs by device; the other three don't depend on the device. Speed scores also move a few points each time a page is tested.

What's behind the speed score

WHAT IT MEASURES	RATING
How fast something first appears on screen	Needs work
How fast the main content appears	Needs work
Whether things shift / jump while loading	Excellent
How responsive the page is to taps / clicks while loading	Poor — weakest point
How quickly the page looks visually "finished"	Needs work

What needs attention

CONFIRMED NEEDS TESTING / MAY BE LIMITED

1. Heavy marketing & tracking code — main cause of the slowness

Found: ~2.2 MB of code across 64 files; four Google tag containers, a Facebook pixel, Klaviyo, Clarity, Judge.me. About **400 KB is never used**.

Means: Direct cause of the poor responsiveness — taps/clicks can be slow to react, costing clicks and sales on phones.

Fix: Review which tags are needed; delay non-essential ones until after the page is usable. **Needs testing** — tags feed ad reporting and some come from Shopify apps, so may not be fully removable.

CONFIRMED STRAIGHTFORWARD

2. Missing a "main content" marker

Found / Fix: No `<main>` marker (verified). Wrap the page body in one — small theme change — so screen-reader users get a "skip to content" shortcut.

CONFIRMED NEEDS INVESTIGATION

3. Relies on third-party cookies (10)

Means / Fix: Browsers increasingly block these, so some tracking/ad features will fade. Move to first-party / server-side tracking where possible — plan with marketing.

CONFIRMED STRAIGHTFORWARD

4. Two security protections not fully in place

Found / Fix: No clear anti-framing ("clickjacking") protection; secure-address redirect unconfirmed. Add the standard header and confirm the redirect — quick settings changes. (HTTPS & others already pass.)

CONFIRMED MOSTLY STRAIGHTFORWARD VIDEO NEEDS TESTING

5. Images, fonts, caching & a 1.4 MB hero video can be lightened

Fix: More efficient images (~142 KB), longer caching (~156 KB), faster font display (~80 ms); show a still image first and defer the hero video (test that it still looks right).

No action needed. An automated check wrongly flagged the **title/description as missing** — verified present & correct: title "High Security Locking Mailboxes | Fort Knox Mailbox".

Page 2 — Collection Page

/pages/high-security-locking-mailboxes

In plain terms. The **healthiest page** of the three. Excellent search optimisation, steady layout, quick to appear. Held back only by the site-wide marketing/tracking code that slows responsiveness a little.

🖥️ Desktop visitor

71	87	73	100
Performance (speed)	Accessibility (ease of use)	Best Practices (security)	Search (SEO)

📱 Mobile visitor

74	87	73	100
Performance (speed)	Accessibility (ease of use)	Best Practices (security)	Search (SEO)

Only the Performance (speed) score differs by device; the other three don't depend on the device. Speed scores also move a few points each time a page is tested.

What's behind the speed score

WHAT IT MEASURES	RATING
How fast something first appears on screen	Excellent
How fast the main content appears	Good
Whether things shift / jump while loading	Excellent
How responsive the page is to taps / clicks while loading	Needs work — weakest point
How quickly the page looks visually “finished”	Needs work

What needs attention

CONFIRMED NEEDS TESTING / MAY BE LIMITED

1. Heavy marketing & tracking code slows responsiveness

Found: About **730 KB of unused** marketing/tracking code (even more than the homepage).

Fix: Delay non-essential tags until after the page is usable. **Needs testing** — same ad-reporting and Shopify-app caveats.

CONFIRMED STRAIGHTFORWARD

2. Missing a “main content” marker

Fix: Add a single `<main>` marker for screen-reader users.

CONFIRMED NEEDS INVESTIGATION

3. Third-party cookies (10) & two security headers

Fix: Plan the cookie move with marketing; add anti-framing protection and confirm the secure-address redirect (quick changes).

No action needed. Same false alarm — title (“High Security Locking Mailboxes | Fort Knox Mailbox”) and description are present & correct.

Page 3 — Product Page

/products/the-bunker-mailbox

In plain terms. The **weakest page** on speed, and the only one where **content visibly shifts as it loads** — risky on the page where people tap "Add to Cart." Two priorities: steady the page, and lighten the marketing code.

🖥️ Desktop visitor

55	86	73	92
Performance (speed)	Accessibility (ease of use)	Best Practices (security)	Search (SEO)

📱 Mobile visitor

52	86	73	92
Performance (speed)	Accessibility (ease of use)	Best Practices (security)	Search (SEO)

Only the Performance (speed) score differs by device; the other three don't depend on the device. Speed scores also move a few points each time a page is tested.

What's behind the speed score

WHAT IT MEASURES	RATING
How fast something first appears on screen	Excellent
How fast the main product image appears	Needs work
Whether things shift / jump while loading	Needs work — notable here
How responsive the page is to taps / clicks while loading	Needs work
How quickly the page looks visually "finished"	Good

What needs attention

CONFIRMED · CAUSE NEEDS CONFIRMING

1. The page content jumps around as it loads

Found: A **noticeable layout shift** as the page loads, well above the comfortable threshold — the other two pages were near zero.

Means: Content moves after it first appears, so a shopper reaching for **"Add to Cart"** or an option can mis-tap — right where you want a smooth checkout start.

Fix: Reserve space for images and dynamic blocks before they load (width/height on product images, fixed sizes for badges/banners). **Confirm the cause in the theme code** first — the images appear to load without a reserved size.

CONFIRMED · MOSTLY STRAIGHTFORWARD

2. The main product image is slow to appear

Fix: Prioritise and optimise the main product image so it loads first and at the right size — it's the slowest content to show here.

CONFIRMED NEEDS TESTING

3. Heavy marketing & tracking code (~730 KB unused)

Fix: Delay non-essential tags until after the page is usable (same site-wide caveats).

CONFIRMED STRAIGHTFORWARD

4. Missing “main content” marker, 12 third-party cookies & two security headers

Fix: Add the `<main>` marker and anti-framing protection (quick), and plan the cookie move with marketing.

No action needed. Same false alarm — title (“Bunker Mailbox : 1/8 Inch Steel Locking Mailbox - Fort Knox Mailbox Store”) and description are present & correct.

Combined Action Plan

In priority order. Items that benefit the whole site are marked “site-wide.”

#	ACTION	NATURE
1	Review & delay non-essential marketing/tracking code (site-wide — biggest speed win)	TEST & MEASURE
2	Stop the **product page** from shifting — reserve space for images/blocks	FIX & VERIFY
3	Add the “main content” accessibility marker (site-wide)	QUICK FIX
4	Add anti-framing protection & confirm secure-address redirect (site-wide)	QUICK FIX
5	Optimise key images (homepage hero, product image), caching & fonts; defer the hero video	LOW RISK
6	Plan a longer-term move away from third-party cookies with marketing (site-wide)	INVESTIGATE

Note: Performance (speed) scores shown here are from our testing and move a few points per run; they can be matched to Fort Knox's own test results on request. No conversion, sales or search-ranking outcome is implied.
